

# Package ‘vectorsurvR’

April 16, 2024

**Type** Package

**Title** Data Access and Analytical Tools for 'VectorSurv' Users

**Version** 0.1.0

**Description** Allows registered 'VectorSurv' <<https://>

//vectorsurv.org/> users access to data through the 'VectorSurv API' <<https://>

//api.vectorsurv.org/>. Additionally provides functions for analysis and visualization.

**License** GPL-3

**Encoding** UTF-8

**LazyData** true

**RoxygenNote** 7.3.1

**Imports** rstudioapi, dplyr, jsonlite, kableExtra, knitr, lubridate,  
stringr, plotly, ggplot2, httr, tidyr, magrittr, DT

**Suggests** testthat (>= 3.0.0), rmarkdown, devtools,

**VignetteBuilder** knitr

**Config/testthat.edition** 3

**Depends** R (>= 2.10)

**NeedsCompilation** no

**Author** Christina De Cesaris [aut, cre]

**Maintainer** Christina De Cesaris <cmdecesaris@ucdavis.edu>

**Repository** CRAN

**Date/Publication** 2024-04-16 08:40:05 UTC

## R topics documented:

getAbundance . . . . .	2
getAbundanceAnomaly . . . . .	3
getArthroCollections . . . . .	4
getInfectionRate . . . . .	5
getPools . . . . .	6
getPoolsComparisionTable . . . . .	7

getToken . . . . .	8
getVectorIndex . . . . .	8
plotInfectionRate . . . . .	9
processAbunAnom . . . . .	10
sample_collections . . . . .	11
sample_pools . . . . .	11

--------------	-----------

---

getAbundance	<i>Get abundance</i>
--------------	----------------------

---

## Description

Calculates abundance

## Usage

```
getAbundance(
  collections,
  interval,
  species_list = NULL,
  trap_list = NULL,
  species_seperate = FALSE
)
```

## Arguments

<code>collections</code>	Collections data retrieved from <code>getArthroCollections()</code>
<code>interval</code>	Calculation interval for abundance, accepts “collection_date”, “Biweek”, “Week”, and “Month”.
<code>species_list</code>	Species filter for calculating abundance. Species_display_name is the accepted notation. To see a list of species present in your data run <code>unique(collections\$species_display_name)</code> . If species is unspecified, the default NULL will return data for all species in data.
<code>trap_list</code>	Trap filter for calculating abundance. Trap_acronym is the accepted notation. Run <code>unique(collections\$trap_acronym)</code> to see trap types present in your data. If trap_list is unspecified, the default NULL will return data for all trap types.
<code>species_seperate</code>	Should the species in species_list have abundance calculated separately? Setting to FALSE calculates the combined abundance. The same result can be performed by calculating on one species at the time.

## Value

A dataframe of abundance values grouped by interval and filtered by parameters

## Examples

```
print(sample_collections)
getAbundance(sample_collections,
            interval = 'Week',
            species_list = list('Cx pipiens'),
            trap_list = list('GRVD', 'C02'),
            species_seperate = FALSE)
```

getAbundanceAnomaly     *Get Abundance Anomaly*

## Description

‘getAbundanceAnomaly(...’ ‘requires at least five years prior to the target\_year of arthro collections data to calculate for the specified parameters. The function uses the methods of the Gateway Abundance Anomaly calculator, and will not work if there is fewer than five years of data present.

## Usage

```
getAbundanceAnomaly(
  collections,
  interval,
  target_year,
  species_list = NULL,
  trap_list = NULL,
  species_seperate = FALSE
)
```

## Arguments

<code>collections</code>	Collections data retrieved from ‘getArthroCollections()’
<code>interval</code>	Calculation interval for abundance, accepts “collection_date”, “Biweek”, “Week”, and “Month”
<code>target_year</code>	Year to calculate analysis on. Collections data must have a year range of at least (target_year - 5, target_year)
<code>species_list</code>	Species filter for calculating abundance. Species_display_name is the accepted notation. To see a list of species present in your data run ‘unique(collections\$species_display_name)’. If species is unspecified, the default NULL will return data for all species in data
<code>trap_list</code>	Trap filter for calculating abundance. Trap_acronym is the accepted notation. Run ‘unique(collections\$trap_acronym)’ to see trap types present in your data. If trap_list is unspecified, the default NULL will return data for all trap types
<code>species_seperate</code>	Should the species in species_list have abundance calculated separately? Setting to FALSE calculates the combined abundance. The same result can be performed by calculating on one species at the time description

**Value**

Abundance anomaly calculation

**Examples**

```
getAbundanceAnomaly(sample_collections, "Biweek", target_year=2020, species_list="Cx pipiens")
```

`getArthroCollections` *Get arthropod collections data*

**Description**

‘getArthroCollections()‘ obtains collections data on a year range (start\_year, end\_year) for authorized VectorSurv Gateway accounts.

**Usage**

```
getArthroCollections(token, start_year, end_year)
```

**Arguments**

token	A valid access token returned from ‘getToken()‘
start_year	Start year of data
end_year	End year of data

**Value**

A data frame of collections data specific to users account

**Examples**

```
## Not run:
token = getToken()
getArthroCollections(token, 2021, 2022)
## End(Not run)
```

---

**getInfectionRate**      *Get Infection Rate*

---

**Description**

‘getInfectionRate()’ requires at least five years prior to the target\_year of arthro collections data to calculate for the specified parameters. The function uses the methods of the Gateway Abundance Anomaly calculator, and will not work if there is fewer than five years of data present.

**Usage**

```
getInfectionRate(  
  pools,  
  interval,  
  target_disease,  
  pt_estimate,  
  scale = 1000,  
  species_list = NULL,  
  trap_list = NULL  
)
```

**Arguments**

pools	Pools data retrieved from ‘getPools()’
interval	Calculation interval for infection rate, accepts “collection_date”, “Biweek”, “Week”, and “Month”
target_disease	The disease to calculate infection rate for—i.e. “WNV”. Disease acronyms are the accepted input. To see a list of disease acronyms, run ‘unique(pools\$target_acronym)’
pt_estimate	The estimation type for infection rate. Options include: “mle”, “bc-mle”, “mir”
scale	Constant to multiply infection rate by
species_list	Species filter for calculating infection rate species_display_name is the accepted notation. To see a list of species present in your data run ‘unique(pools\$species_display_name)’. If species is unspecified, the default ‘NULL’ will return data for all species in data.
trap_list	Trap filter for calculating infection rate. Trap_acronym is the accepted notation. Run ‘unique(pools\$trap_acronym)’ to see trap types present in your data. If trap_list is unspecified, the default ‘NULL’ will return data for all trap types.

**Value**

Infection rate calculation

**Examples**

```
getInfectionRate(sample_pools,
                 interval = "Biweek",
                 target_disease = "WNV",
                 pt_estimate = "mle",
                 scale = 1000,
                 species_list = list("Cx pipiens"),
                 trap_list = list("CO2"))
```

getPools

*Get Pools data***Description**

Retrieves VectorSurv pools data for desired year range

**Usage**

```
getPools(token, start_year, end_year)
```

**Arguments**

token	access token retrieved from getToken()
start_year	Beginning of year range
end_year	End of year range

**Value**

Dataframe of pools data

**Examples**

```
## Not run:
token = getToken()
getPools(token, 2020, 2021)
## End(Not run)
```

---

```
getPoolsComparisionTable  
Get Pools Frequency Table
```

---

## Description

‘getPoolsComparisionTable()‘ produces a frequency table for positive, negative, and pending pools counts by year and species. The more years present in the data, the larger the table.

## Usage

```
getPoolsComparisionTable(  
  pools,  
  interval,  
  target_disease,  
  species_seperate = FALSE  
)
```

## Arguments

pools	Pools data retrieved from ‘getPools()‘
interval	Calculation interval for comparison table, accepts “collection_date”, “Biweek”, “Week”, and “Month”
target_disease	The disease to calculate infection rate for—i.e. “WNV”. Disease acronyms are the accepted input. To see a list of disease acronyms, run ‘unique(pools\$target_acronym)‘
species_seperate	Should the pools comparison be split by species of each pool. Default is FALSE

## Value

Frequency table of for pools data

## Examples

```
getPoolsComparisionTable(sample_pools,  
  interval = "Biweek",  
  target_disease = "WNV",  
  species_seperate = TRUE)
```

getToken

*Get Token***Description**

getToken() returns a token needed to run getArthroCollections() and getPools(). The function prompts users for a VectorSurv account credentials.

**Usage**

```
getToken()
```

**Value**

User token

**Examples**

```
## Not run: token = getToken()
```

getVectorIndex

*Get Vector Index***Description**

'getVectorIndex()' requires at least five years prior to the target\_year of arthro collections data to calculate for the specified parameters. The function uses the methods of the Gateway Abundance Anomaly calculator, and will not work if there is fewer than five years of data present.

**Usage**

```
getVectorIndex(
  collections,
  pools,
  interval,
  target_disease,
  pt_estimate,
  scale = 1000,
  species_list = NULL,
  trap_list = NULL
)
```

**Arguments**

<code>collections</code>	Collections data retrieved from ‘getArthroCollections()‘
<code>pools</code>	Pools data retrieved from ‘getPools()‘
<code>interval</code>	Calculation interval for vector index, accepts “collection_date”, “Biweek”, “Week”, and “Month”
<code>target_disease</code>	The disease to calculate infection rate for—i.e. “WNV”. Disease acronyms are the accepted input. To see a list of disease acronyms, run ‘unique(pools\$target_acronym)‘
<code>pt_estimate</code>	The estimation type for infection rate. Options include: “mle”, “bc-mle”, “mir”
<code>scale</code>	Constant to multiply infection rate
<code>species_list</code>	Species filter for calculating abundance. Species_display_name is the accepted notation. To see a list of species present in your data run ‘unique(pools\$species_display_name)‘. If species is unspecified, the default ‘NULL‘ will return data for all species in data.
<code>trap_list</code>	Trap filter for calculating abundance. Trap_acronym is the accepted notation. Run ‘unique(pools\$trap_acronym)‘ to see trap types present in your data. If trap_list is unspecified, the default ‘NULL‘ will return data for all trap types.

**Value**

Vector index calculation

**Examples**

```
getVectorIndex(sample_collections, sample_pools, "Month", "WNV", "mle" )
```

`plotInfectionRate`

*Plot Infection Rate*

**Description**

`plotInfectionRate()` plots the output returned from ‘getInfectionRate()‘ with confidence intervals using ggplot

**Usage**

```
plotInfectionRate(InfRtOutput, year)
```

**Arguments**

<code>InfRtOutput</code>	Output from returned ‘getInfectionRate()‘
<code>year</code>	Year to plot infection rate on

**Value**

ggplot object

## Examples

```
IR = getInfectionRate(sample_pools,
                      interval = "Week",
                      target_disease = "WNV",
                      pt_estimate = "mle", species_list = c("Cx pipiens"),
                      trap_list = c("C02","GRVD") )
plotInfectionRate(InfRtOutput = IR, year = 2017)
```

**processAbunAnom**

*process Abundance Anomaly*

## Description

‘processAbunAnom()‘ processes the output returned from ‘getAbundanceAnomaly()‘ into a long form suitable for plotting in ‘ggplot‘

## Usage

```
processAbunAnom(AbAnomOutput)
```

## Arguments

AbAnomOutput     output from ‘getAbunAnom()‘

## Value

Abundance anomaly output processed into long form

## Examples

```
AbAnOut = getAbundanceAnomaly(sample_collections,
                               interval = "Biweek",
                               target_year = 2020,
                               species_list = c("Cx tarsalis", "Cx pipiens"),
                               species_seperate = TRUE)
AbAnOut_L = processAbunAnom(AbAnOut)
```

---

sample\_collections      *Sample Arthropod Collections Data*

---

### Description

Sample Arthropod Collections data imitates the essential components of real collections data

### Usage

```
sample_collections
```

### Format

A data frame with 200 rows and 10 variables:

```
collection_id  double Collection identification number  
collection_date character The date the trap was picked up for collection  
num_trap integer The number of unique traps in operation at one site  
surv_year double Surveillance year of collection  
trap_nights integer The number of nights a trap was in the field  
trap_problem_bit logical If these was an issue with the trap  
num_count integer Number of arthropods present in collection  
sex_type character Sex of collected arthropods  
species_display_name character Species name of collected arthropods  
trap_acronym character The acronym of the trap placed in the field
```

### Source

<https://vectorsurv.org/>

---

sample\_pools      *Sample Pools Data*

---

### Description

Sample Pools data imitates the essential components of real pools data needed for calculations

### Usage

```
sample_pools
```

**Format**

A data frame with 82644 rows and 10 variables:

```
pool_id integer Pool identification number  
surv_year integer Surveillance year of pool  
collection_date character The date the trap was picked up for collection  
sex integer Sex of collected arthropods  
num_count integer Number of arthropods present in collection  
target_acronym character The disease being tested for in the pool  
status_name character Status of the tested disease  
trap_acronym character The acronym of the trap placed in the field  
species_display_name character Species name of collected arthropods
```
